2030 Projections: GIS Associates, 2010b

Totals and percentages shown may not be exact due to rounding; commas have been added to figures for percent change, to assist with readability.

*Suppliers with an average daily flow of greater than or equal to 0.10 million gallons per day (mgd)

†Private domestic wells and suppliers with an average daily flow of less than 0.10 mgd

††Private domestic wells and suppliers with an average daily flow of less than 0.10 mgd

(May also include areas to be served by large public suppliers in the future, but those public suppliers are yet undetermined.)

Note: Public water supply utility service areas often include residences that derive their water supplies from privately owned (domestic self-supply) wells. Typically, these domestic self-supply water uses existed prior to their locations becoming part of public water supply service areas. For public water supply service areas, SJRWMD does not have sufficient information to separate the populations served by public supply systems from those served by domestic self-supply wells. Therefore, public water supply populations estimated by SJRWMD often include some domestic self-supply populations. Public supply populations reported by SJRWMD for 2005 are greater than for 1995, because many public supply service areas increased in size substantially from 1995 to 2005. Conversely, many domestic self-supply populations and water use estimates reported from 2005 are lower than for 1995.
